

UNSEEN

A Privacy-Focused Social Platform

Web Platform + Android APK

Live Website: <https://unseen-world.vercel.app/>

Public Portfolio Case Study • 2026 Edition

Project Overview

UNSEEN is a privacy-focused social platform built for sharing thoughts, discovering conversations, and connecting with others through a modern, responsive experience. Traditional social networks rely heavily on tracking identities, curation pressure, and public profiles. UNSEEN shifts the paradigm by prioritizing authentic, anonymous-first interactions in a high-fidelity visual workspace.

Area	Description
Product	Privacy-focused anonymous social platform
Platforms	Responsive website + Android APK Client
Focus	Real-time interactions, usability, and consistent mobile wrappers

PROJECT GOAL

Build a modern social platform that feels intuitive, responsive, and consistent across web browsers and Android devices.

How Users Experience UNSEEN

The UNSEEN user journey is designed to be frictionless, transitioning users instantly from onboarding to active engagement. The flows protect identities by generating random adjective-noun combinations during account activation.

Primary User Journey Flow:

Feed Interaction Lifecycle:

This architectural flow isolates client-side presentation states from personal database keys, ensuring that your public feed experiences remain safe, highly interactive, and completely decoupled from real-world identities.

Core Social Features

Feature	User Value	Availability
Create & Delete Posts	Share confessions and thoughts easily	Web + APK
Likes & Saved Posts	Engage with feed content and compile collections	Web + APK
Comments & Replies	Participate in threaded discussions	Web + APK
Follow / Unfollow	Build networks and personal following feeds	Web + APK
Search & Trends	Discover popular conversations and hashtags	Web + APK
Report Tools	Flag inappropriate posts to keep safety high	Web + APK
Responsive Design	Adapts smoothly to desktop, tablets, and phones	Web + APK

■ Create Post

Publish text confessions under an automatically assigned alias name.

■ Comment Threads

Reply directly to posts with nested conversations.

■ Hashtags

Tag posts with mood labels (e.g. #mood) to group feeds.

■■ Report Posts

Flag inappropriate content. Posts with 5+ reports are hidden.

Designed for Live Interaction

UNSEEN handles real-time data flows to create a highly responsive social loop. Rather than relying on manual page reloads, the platform syncs counts and new activities smoothly in the background.

■ Live Feed Updates

New posts appear at the top of the feed smoothly when near top, or show a non-intrusive banner.

♥■ Fast Likes & Saves

Interactions update counts in the store instantly, resolving state discrepancies cleanly.

■ Live Comments

Conversations update automatically as new replies are published on the backend server.

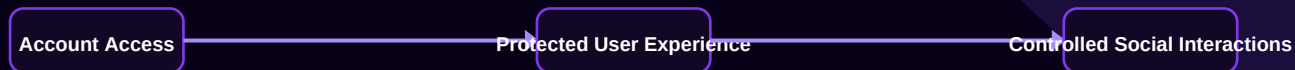

■ Badge Synchronization

Messages and notification badges synchronize across active devices instantly.

Experience Area	Traditional Refresh-Based UI	UNSEEN Approach
New Activity	Manual pull-to-refresh required	Updates appear automatically
Likes & Saves	Delayed visual feedback	Immediate visual response (Optimistic)
Comments & Feeds	Static until page reload	Background synchronization

Privacy-Focused by Design

Privacy is not an afterthought in UNSEEN; it is the platform's core architecture. User sessions, credentials, and social connections are decoupled from real-world identifiers, encouraging authentic yet responsible sharing.

■ Protected Account Access

Secure account creation with optional email recovery to protect personal information.

■ Terms & Policies

Clear guidelines and Terms of Service govern platform interactions from the ground up.

■ Content Moderation Tools

Users can report inappropriate content. Auto-flagging keeps the feed clean.

■ Controlled Social Options

Users control who they follow, what they save, and what they share in their profile.

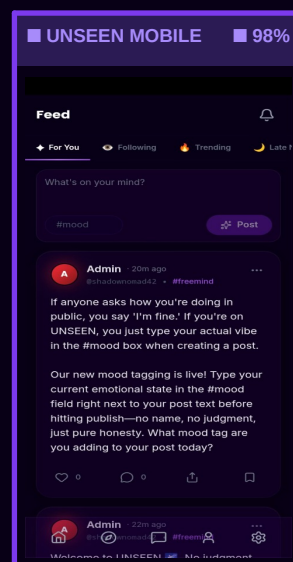

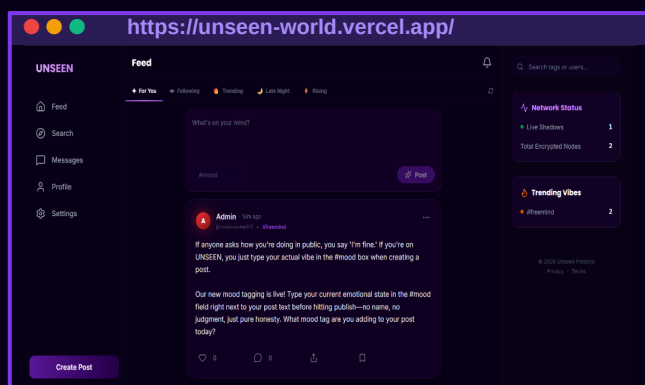

PRIVACY MANIFESTO

UNSEEN is designed to encourage responsible social interaction while keeping privacy and user control central to the experience.

One Platform, Multiple Experiences

The UNSEEN experience adapts perfectly to your environment. Whether accessed via a desktop web browser or installed as a native Android APK wrapper, layout structures, real-time listeners, and asset scaling remain highly aligned.

Responsive Web Platform	Android APK Client
Desktop and mobile browser access	App-like mobile experience
Responsive fluid layouts	Native app launcher icon and splash flow
Easy access via a link	Convenient home-screen access
Discoverable through search optimization	Designed for Android devices

Technology Overview

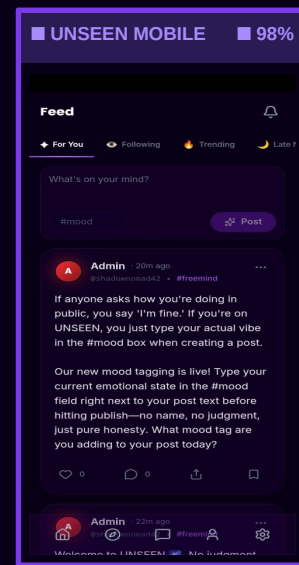

The UNSEEN ecosystem consists of modular backend API routers, connection gateways, and client interfaces. By leveraging standard, modern web technologies, the architecture ensures fast response times and stable data synchronization.

Layer	Technology Used	Description
Frontend	React.js, Next.js, Tailwind CSS	Modern web component layouts with responsive scaling
Backend	Node.js, Express.js	Lightweight, modular REST API services
Database	MongoDB, Mongoose ORM	Document-based storage schemas with indexes
Real-Time	Socket.io (WebSockets)	Bi-directional, low-latency client communication
Deployment	Vercel & Render hosting	Automated deployment with SSL and custom routing
Android Client	Android SDK, Kotlin WebView	Native-like wrapper with adaptive launcher support

Responsive Design System

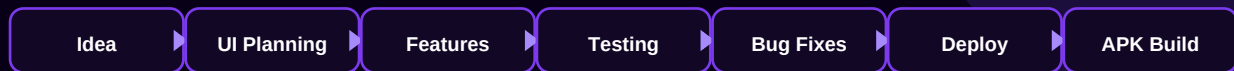

UNSEEN was built from the ground up with a mobile-first philosophy. The user interface handles screen changes, aligning grid lists, collapsing sidebar navigations, and resizing content fields smoothly.

The interface was refined for readable layouts, clear actions, and consistent interaction across different screen sizes.

From Idea to Deployment

Development Timeline:

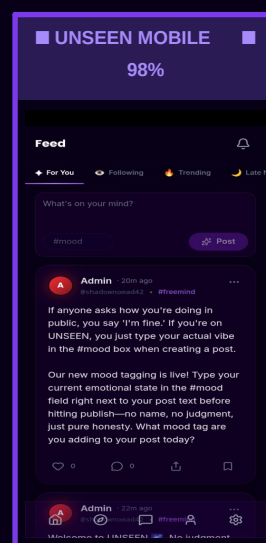

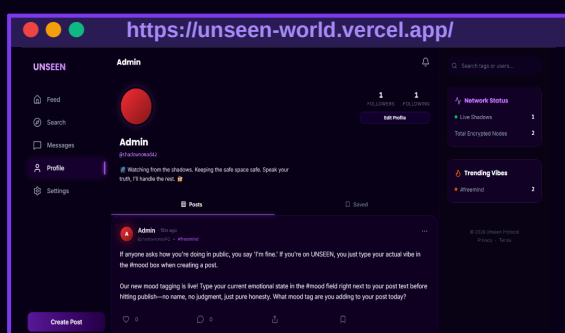

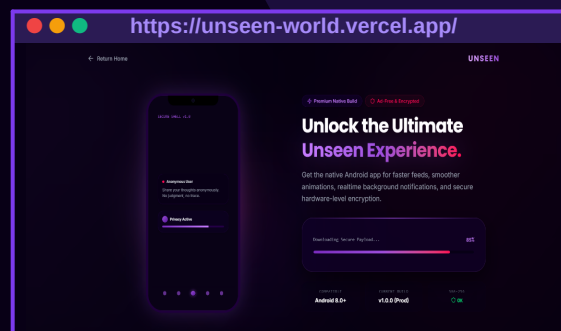

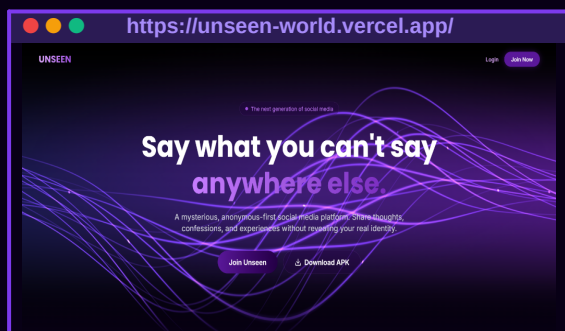

Development Approach:

UNSEEN was developed with the support of Antigravity as an AI development assistant. I directed the product requirements, selected features, tested the experience, identified issues, made UX decisions, and managed iterative improvements and deployment.

Learning Area	Key Takeaway
User Experience	Familiar labels and clear actions improve usability.
Real-Time Behavior	Live updates need careful state synchronization to prevent layout jumps.
Mobile Design	Layout and navigation must be tested on actual smaller screens.
Performance	Fast-feeling interactions require thoughtful client-side UI state handling.
Deployment	Production testing reveals issues not visible during local development.
